Investigation	Observed Value	Unit	Biological Reference Interval

Mentzer Index is an automated cell-counter-based calculated parameter (MCV/RBC) used to differentiate cases of Iron Deficiency Anemia (IDA) (MI > 13) from Beta Thalassemia Trait (MI < 13) in patients presenting with microcytic anemia. The Mentzer Index (MI) serves as a screening tool and is not diagnostic on its own.

Advice: If MI is < 13, it is recommended to perform abnormal hemoglobin studies and HbA2 estimation by HPLC (Test Code: A0001) to evaluate for Beta Thalassemia Trait. Iron studies (Test Code: I0286) may also be considered to rule out concurrent iron deficiency. Clinical correlation and further genetic testing are essential for definitive diagnosis.
